Machines and Humans

Lina Zhu

April 19,2018

In the article, we mentioned that artificial intelligence is closely related to the ability of computers to think. With the continuous development of computers, the rapid calculation and reaction of computers has caused human pressure. For the possibility of computer thinking, we tend to think that humans think, although we often call people reckless or unthinking. Non-human life forms also bring many problems, such as animal behavior ability and thinking, the idea of truth is also applicable to other psychological process, we are forced to work to carry on the strict censorship of human minds. The development of artificial intelligence may affect human beings as machines perform well in many life forms.

I think we should develop and utilize artificial intelligence rationally, take its essence and discard its dregs. With the joint efforts of mankind, the development of artificial intelligence machine language is broader, and it also brings good news to people.
